

CYPHER Training School

Machine Learning for
Reacting Flows
Dynamical System Modelling
Hands-on session

Anh Khoa Doan

Short instructions

Scripts and data available here:

https://github.com/adoanTUD/CYPHER_MLSchool

Slides also available on the git repo

Structure of the session

1. 5-minute recap
2. Guide through example notebook: Lorenz system
3. Description of the exercise: Learning flame dynamics

Modelling of time series with feedforward neural networks

- Assume we want to model a time-dependent process:

$$\dot{\mathbf{y}}(t) = \mathcal{F}(\mathbf{y}, \mathbf{u})$$

$$\rightarrow \mathbf{y}_t = \mathcal{F}_d \left(\mathbf{y}_{t-1}, \dots, \mathbf{y}_{t-N_{t,y}}, \mathbf{u}_t, \dots, \mathbf{u}_{t-N_{t,u}} \right)$$

Typical feedforward-based architecture

Time series of past input
and prediction

$N_{t,u}, N_{t,y}$: duration of
“relevant past
information”

Modelling of time series with recurrent neural network

- Assume we want to model a time-dependent process:

$$\dot{\mathbf{y}}(t) = \mathcal{F}(\mathbf{y}, \mathbf{u})$$

$$\rightarrow \mathbf{y}_t = \mathcal{F}_d \left(\mathbf{y}_{t-1}, \dots, \mathbf{y}_{t-N_{t,y}}, \mathbf{u}_t, \dots, \mathbf{u}_{t-N_{t,u}} \right)$$

Two possible recurrent approaches with RNNs:

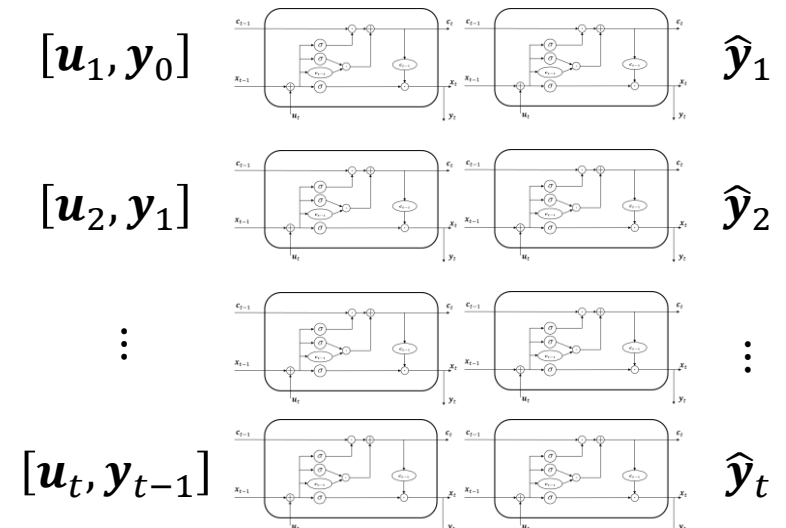

“Many to one” approach:

Time series of
past input and
prediction

$N_{t,u}$, $N_{t,y}$: duration
of “relevant past
information”

“Many to many” approach:

Structure of the session

1. 5-minute recap
2. **Guide through example notebook: Lorenz system**
3. Description of the exercise: Learning flame dynamics

Guided exercise: Lorenz system

- Developed originally as a model of atmospheric convection
$$\frac{dx}{dt} = \sigma(y - x), \frac{dy}{dt} = x(\rho - z) - y, \frac{dz}{dt} = xy - \beta z$$
- Simplified model that exhibits chaotic behaviour.

$$\rho = 28, \sigma = 10, \beta = 8/3$$

Guided exercise: Lorenz system

Data: Time series of the Lorenz system

Objective: predict next time step based on previous ones:

$$x(t) = \mathcal{F}(x(t-1), \dots, x(t-N))$$

Steps:

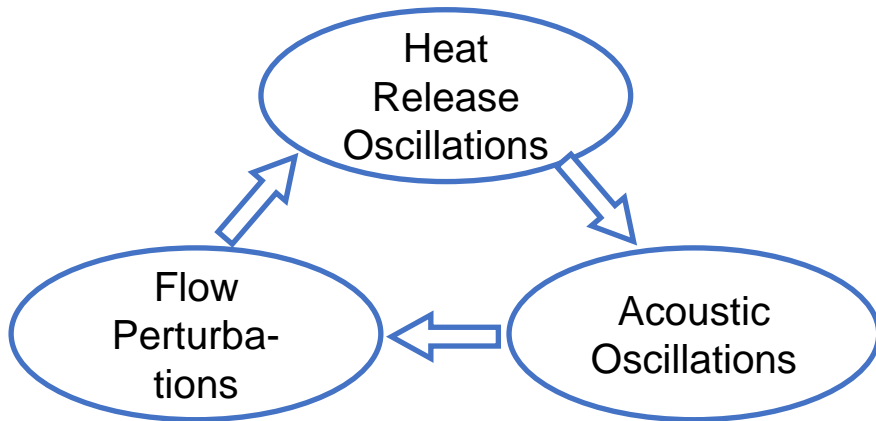

1. Restructure datasets into appropriate (input,pair)
2. Design the network
3. Train

Structure of the session

1. 5-minute recap
2. Guide through example notebook: Lorenz system
3. **Description of the exercise: Learning flame dynamics**

Thermoacoustic instabilities result from heat release rate oscillations

- Thermoacoustic instabilities: High amplitude pressure oscillations in 'lean premixed' combustors

- Prediction requires a coupling between:

- *Acoustic model*

- *Flame model: $\dot{Q}' = f(u')$*

NN must be trained to learn flame dynamics ($\dot{Q}' = f(u')$) of a laminar slit flame

- Premixed methane-air laminar slit burner (equivalence ratio of 0.8)
- Fully resolved with DNS

Objective: Design a neural networks trained using the data from broadband simulation

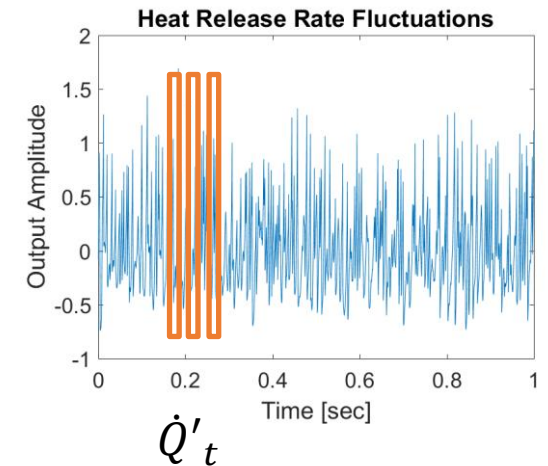

Similar steps as for Lorenz case except input and output are different signals

Overall exercise

- Objective: Develop a neural network model of the flame response
- 3 training datasets provided for different amplitudes of excitations
- Two approaches possible
 - Feedforward NN
 - Recurrent neural network
- Study of the accuracy of the trained NN depending on the training dataset used
- Study on the impact of the length of the dataset used for training

Steps for the exercise

1. Preprocess the dataset
 - Consider undersampling
2. From the data provided, create the appropriate “input/output” pairs
 - Pay attention of your choice of “history” (N)
3. Design and train the network

Assessment of the trained neural network : comparison with harmonic forcing

4. Compute the flame describing function $F(\omega, |u'|) = \frac{\dot{Q}'(\omega, |u'|)/\bar{Q}}{u'(\omega, |u'|)/\bar{u}}$

- Create harmonic signals at given frequencies
- Feed them to your trained network

- Deduce the gain (ratio between input and output) and phase (normalised time shift between input/output)
